

Athena

Build up your system brick by brick

The breakthrough solution in patient monitoring. The answer to present needs and future demands. The monitoring and information system. Collects, handles and presents up to 16 physiological parameters, from ECG and respiration, through to cardiac output, endtidal CO₂ and oxygen saturation. Central monitoring is available with up to 24 connected bedside scopes, and bed to bed communication is available throughout the system. With the new concept of display and amplifier controls, patient monitoring has become easier and safer and contrary to conventional systems, truly flexible.

*You do not have to adapt to Athena,
Athena adapts to you.*
