persistent nitroglycerin treatment but terminated at least 4 h before ischaemia combined with intraperitoneal injection of ethanol (0.5 g/kg). Cardiac mitochondria was isolated after reperfusion. Three parameters were measured: (1) serum CK activity before ischaemia and after reperfusion; (2) after incubation with fluorescent probe JC-1, Δψ of isolated mitochondrial was evaluated by fluorometer and fluorescent microscope; (3) ALDH2 activity was determined spectrophotometrically by monitoring the reductive reaction of NAD\(^+\) to NADH at 340 nm.

**Results**

(1) Ethanol treatment caused a 27% increase in ALDH2 activity relative to control (2.74±0.37 and 2.15±0.46, p=0.044); Treatment with persistent nitroglycerin decreased ALDH2 activity by 27% compared with ethanol treatment (2.00±0.47 and 2.15±0.46, p=0.024). There was no statistical difference in ALDH2 activity between GTN-ON and control group (2.00±0.47 and 2.15±0.46, p=0.642). (2) Δψ in cardiac myocytes in ethanol group and GTN-OFF group were 2.5 and 2.4 times higher than in control respectively. Δψ in cardiac myocytes in GTN-ON group was reduced by 51% (119.33±10.21 and 242.20±52.18, p=0.006) and 42% (119.33±10.21 and 204.00±56.17, p=0.005) than that in ethanol and GTN-ON group respectively. (3) Cardiac damage was reduced by 59% (0.37±0.20 and 0.61±0.12, p=0.029) and 41% (0.36±0.10 and 0.61±0.12, p=0.031) in ethanol group and GTN-ON group compared with that in control.

**Conclusions**

Acute activation of ALDH2 reduced myocardial ischaemia/reperfusion injury possibly by preserving Δψ.

**e0029** SURVIVAL OF TRANSPLANTED CELLS IN INFARCTED MYOCARDIUM AND EFFECT OF INDUCED NITRIC OXIDE SYNTHETASE INHIBITOR

doi:10.1136/hrt.2010.208967.29

Li Hongmin, Li Hongmin. Department of Cardiology, Changzheng Hospital Affiliated To The Second Military Medical University, Shanghai

**Objective**

Cell transplantation was supposed to be a therapeutic strategy of myocardial infarction, but the problem was that most of the transplanted cells died at the early stage of transplantation. We hypothesised that over-activation of induced nitric oxide synthase (iNOS) may play an important role in the death of transplanted cells. In this experiment, we investigated the effect of iNOS selective inhibitor on the survival of transplanted bone marrow stem cells (BMSCs).

**Methods**

BMSCs were isolated from the male SD rats. Female SD rats were subjected to myocardial infarction by ligation of left anterior descending artery. BMSCs at 1.2×10^6 were injected into the central zone of the infarct region at 1 h after ligation. BMSCs were monitored by labelled BrdU or Hoechst33342. A Sry gene sequence of Y chromosome in the infarct region at 1 h after ligation. BMSCs were monitored by labelled BrdU or Hoechst33342. A Sry gene sequence of Y chromosome in the infarct region at 1 h after ligation. BMSCs were monitored by labelled BrdU or Hoechst33342. A Sry gene sequence of Y chromosome in the infarct region at 1 h after ligation.

**Results**

The cultured BMSCs showed a homogenous pattern with CD44+/CD34−. Accumulation of BMSCs labelled with Hoechst33342 or BrdU was noted in infarct area of the host heart. Myocardial infarction induced a significant iNOS expression with its peak expression on day 3 and lasting for 14 days. The survival rates of engrafted BMSCs by real-time PCR were 7.88%, 7.82% and 8.73% at 1 week, 3 weeks and 6 weeks after transplantation respectively. iNOS selective inhibitor 1400 W contributed to 32% increase in the survival rate of engrafted BMSCs.

**Conclusion**

Acute activation of iNOS selective inhibitor 1400 W may result in 32% increase in the survival rate of transplanted BMSCs.

**e0030** MESENCHYMAL STEM CELLS TRANSFECTED WITH HCN4 GENES BY LENTIV TO CREATE CARDIAC PACEMAKERS

doi:10.1136/hrt.2010.208967.30

1Zhou Yafeng, 2Yang Xiangjun. 1Department of Cardiology, The First Affiliated Hospital of Soochow University; 2Department of Cardiology, Soochow University, China

**Objective**

The study was to test proof-of-principle if genetically engineered mesenchymal stem cells (MSCs) transfected with HCN4 genes can be modified to be cardiac pacemaker cells.

**Methods**

1. MSCs of rabbit were isolated from the posterior iliac crest of rabbit and were used from passages 2 to 4. 2. The self-inactivating HIV1-based lentiviral vector (LentiV) was used as transgene delivery, which was constructed with plasmid hHCN4/pCDNA3. 3. Total RNA was extracted from control MSCs and those transfected with hHCN4, and RT-PCR was performed. 4. Membrane proteins were extracted from control MSCs and those transfected with hHCN4. Western blot analysis was performed. 5. Whole-cell patch clamp was used to study membrane currents. After the If was recorded, cells were superfused with extracellular solution containing 4 mM caesium chloride and the currents were measured accordingly. 6. MSCs transfected with either GFP alone or GFP-hHCN4 were cocultured with neonatal rabbit ventricular myocytes. The coupling beating rate of cardiac myocytes was measured after 5 days of coculture.

**Results**

1. In addition to expressing characteristic hHCN4 protein, mHCN4-transfected hMSCs also express an anticipated high level of hHCN4 gene by RT-PCR and Western blot analysis. 2. If was elicited using hyperpolarizing steps in 10-mV increments from −40 mV to −140 mV, and it was significantly inhibited by 4 mM caesium chloride. 3. The coupling beating rate of cardiac myocytes was 87±11 bpm when MSCs were transfected with control plasmid (expressing only GFP) and 142±14 bpm when MSCs were expressing both GFP+hHCN4 (p<0.05).

**Conclusion**

The MSC expressing hHCN4 is a demonstration of feasibility of preparing MSC-based biological pacemaker cells. The study provides a platform for further investigation of the possibility of modifying cardiac excitability with genetically engineered MSCs transfected with HCN4 gene by LentiV. MSCs transfected with hHCN4 genes by LentiV are potentially capable of actively pacing ventricular cardiac myocytes and can potentially be modified to be cardiac pacemaker cells.

**e0031** CHARACTER OF PACEMAKER CURRENT IN MESENCHYMAL STEM CELLS TRANSFECTED WITH HCN4 GENES

doi:10.1136/hrt.2010.208967.31

Zhou Yafeng, Yang Xiangjun. Department of Cardiology, The First Affiliated Hospital of Soochow University, China

**Objective**

To test if the pacemaker current can be elicited from mesenchymal stem cells (MSCs) transfected with HCN4 genes by LentiV.

**Methods**

1. MSCs of rabbit from the posterior iliac crest of rabbit were cultured at 37°C in a humidified atmosphere of 5% CO2. 2. The self-inactivating HIV-based lentiviral vector (LentiV) was used as transgene delivery, which was constructed with plasmid hHCN4/pcDNA3. 3. Total RNA was extracted from control MSCs and those transfected with hHCN4, and RT-PCR was performed. 4. Whole-cell patch clamp was used to study membrane currents. If was elicited in the whole cell configuration by holding cells at −40 mV for 50 ms followed by 10-mV steps (2 s) to −130 mV and returned to −40 mV (50 ms) after each step. After the If was recorded, cells were superfused with extracellular solution containing 4 mM caesium chloride and the currents were measured accordingly.
