Pilgrim T, Windecker S. Antiplatelet therapy for secondary prevention of coronary artery disease. *Heart* 2014;100:1750–56. doi:10.1136/heartjnl-2013-305399corr1

In this paper the below paragraph contains 2 dosage errors.

‘According to the guidelines on myocardial revascularisation by the European Society of Cardiology DAPT with aspirin (75–100 mg four times a day) (IB) and clopidogrel (75 mg four times a day) (IA) in the setting of stable CAD is recommended for at least 1 month in patients treated with BMS and for 6–12 months in patients after DES implantation’.

Both dosages should be prescribed daily and not four times a day as stated in the published version.
