

Supplementary figure 2. ECG findings in the 95 athletes excluded from the study based on initial ECG findings at the pre-participation evaluation (PPE). Of these, 64 (67%) had positive follow-up ECGs (corresponding to 'red' findings in 'International recommendations for ECG interpretation in athletes', Sharma et al. (2018), Eur Heart J 39:1466-80), while 29 had negative ECGs at follow-up examination ('green' or 'yellow' findings).

*) Pathological Q-wave definition differed slightly from the International Criteria, and was defined as >3 mm in depth or >40 ms in two or more leads (excl. III and aVR).

WPW, Wolf-Parkinson White; PVC, pre-mature ventricular contraction; QTc, QT time corrected by Bazett formula; LAD, left-axis deviation.
