**Socioeconomic Status Index (higher value, higher SES)**

Educational qualification: (1-degree or equivalent, 2-higher education below degree, 3-GCE A levels, NVQ3 or equivalent, 4-GCE O levels, NVQ2 or equivalent, 5-CSE/NVQ1 or equivalent, 6-Other, 7-No qualification)

Social class: (1-managerial and professional occupations, 2-intermediate occupations, 3-small employers and own account workers, 4-lower supervisory and technical occupations, 5-semi-routine and routine occupations, 6-never worked, unemployment or other)

Total net (non-pension) wealth (in quintiles, lower value wealthier)

**CVD Risk Index**

Hypertension (HYP) was defined as having a self-reported diagnosis of hypertension or having a systolic blood pressure \( \geq 140 \text{ mm Hg} \) or diastolic blood pressure \( \geq 90 \text{ mm Hg} \).\(^1\)

Cholesterol risk (CHO) was derived based on total cholesterol to HDL-cholesterol (TC/HDL-C) ratio, which was defined as > 4 for men and >3.5 for women.\(^2\)
Diabetes (DIA) was defined as having self-reported diagnosis of diabetes or a fasting glucose level $\geq 7$ mmol/l.\textsuperscript{3}

Obesity (OBE) was defined as having a BMI $\geq 30$ in line with the WHO definition.

Abdominal obesity (ABD) was defined as having a waist circumference $\geq 102$ cm for men and $\geq 88$ cm for women.\textsuperscript{4}

Depression (DEP) were measured using the eight-item Centre for Epidemiological Studies-Depression (CES-D) scale, in addition to reported physician diagnoses of clinical depression. We derived a summary score by adding binary responses to all 8 questions. The cut point of 4 was used for defining the risk of serious depressive symptoms as validated in previous studies.\textsuperscript{5}

Abnormal sleep (SLE) was defined as $\leq 5$ hours or $\geq 9$ hours of sleeping.\textsuperscript{6}

Smoking (SMO) was coded as non-smoker, ex-smoker and current smoker.

Poor diet (DIE) was defined as having $< 5$ portions of fruits and vegetables daily which is the public health recommended intake in the UK.

Physical inactivity (INA) was defined as people who exercised less than weekly at either vigorous (e.g. running, swimming, cycling, aerobics and tennis) or moderate levels (gardening, walking, dancing etc).

The confirmatory factor analysis (CFA) model based on these risk indicators is presented in Figure S1. As all indicators were coded as binary variables, the CFA model was fitted using diagonally weighted least squares (DWLS) indicators. The root mean square error of approximation (RMSEA) had a value of 0.03, showing a good fit.\textsuperscript{7} This was also confirmed by the comparative fit index (CFI=0.99), and Tucker–Lewis index (TLI=0.98).
