ADDENDUM

While this article was in press, Schwartz and Marcus (Schwartz, S. P., and Marcus, H. (1942) *Amer. Rev. Tuberc.*, **46**, 35) reported a number of cases of our Type IV and several of our Type VI pattern. These patterns occurred predominantly in cases of chronic cor pulmonale. From their autopsy data in 7 such cases, as well as in 2 additional cases of congenital heart disease, the patterns appear to be most commonly associated with predominant hypertrophy of the right ventricle. However, they also occurred in the absence of ventricular hypertrophy when the right ventricle was dilated.
