Conclusions QT/RR slope of DCM sudden death group was higher than DCM non sudden death and Con group significantly. QT/RR slope show high predicting value for sudden death in DCM patients independently or combined with NSVT or LVEF.

**e0336** EFFECT OF TAURINE ON VASCULAR SMOOTH MUSCLE CELLS APOPTOSIS IN ATHEROSCLEROTIC RABBITS

doi:10.1136/hrt.2010.208967.336

1Zhai Gui-Lan, 2Zhu Huan-Lin, 1Dong Zhi-Hua. 1The First Affiliated Hospital of Liaoning Medical college, 2The 205 Hospital of Chinese PLA, Liaoning

Objective To study the effect of taurine on the apoptosis of vascular smooth muscle cells in atherosclerotic model of rabbits and the mechanism of anti-atherosclerosis.

Methods 21 male Japanese white rabbits were divided into three groups: normal control group, high cholesterol group and taurine group. The normal control group were fed with standard Chow diet and two other groups with a high fat diet. The taurine group were fed with taurine solution once a day, two other groups were given normal saline gastric feeding. Twelve weeks later the modelling was determined successful, all rabbits were killed with air embolism method and exposed the heart, isolated and cut aorta from aortic valve to the bifurcation of abdominal aorta blood vessel. Observing the pathomorphological changes in aorta wall and ultra-structures of VSMCs were observed by electronic microscopy, the apoptotic rate of VSMCs detected by flow cytometry, expression of bcl-2 and bax proteins were detected by immunohistochemistry and expression of caspase-3 proteins were detected by Western blot.

Results The aortic intima of normal control group was smooth, no plaque formation; the high cholesterol group was uneven and rough, there were many needle-like white mastoid processes, some fused into pieces; the above-mentioned diseases of the taurine group were less and not typical.

Conclusions Taurine can prevent the formation of atherosclerosis and inhibit the apoptosis of VSMCs in the atherosclerotic plaque by regulating the bcl-2, bax and caspase-3 proteins.

**e0337** MALLEOULUS ARM INDEX CLINICAL PRACTICE ANALYSIS

doi:10.1136/hrt.2010.208967.337

Liping Yang, Songsheng Yang, Zongning Chen, Gutian Zhao, Yin Wei, Yuan Zhao, Xuehua Zhao. Lijiang Municipal People’s Hospital

Objective To evaluate ABI abnormalities and associated risk factors, we measured ankle brachial index (ABI) of cardiovascular-event high-risk patients. The first step enquires the cardiovascular-event high-risk to win high limit of the ABI abnormality.

Methods We measured the ABI of 775 cases of hospitalised cardiovascular-event high-risk patients. ABI<0.9 and ABI>1.3 are defined as abnormal. Collected data and process statistics analysis to investigate the independent risk factors of ABI.

Results The incidence of abnormal ABI is 54%. Among them ABI<0.9 have 12.4%, Independent risk factors to predict ABI abnormalities are: sex, age, diabetes, creatinine abnormalities, mellitus, hypertension, high cholesterol, high smoking. In cardiovascular-event high-risk ABI<0.9 and ABI>1.3 all show obvious difference. The ABI no show obvious difference in difference clan.

Conclusions In patients with cardiovascular-event high-risk ABI<0.9 and ABI>1.3 are abnormal. ABI abnormalities are particularly prevalent in the old, smokers and patients with hypertension, diabetes or dyslipidemia. The difference of ABI between each clan did not show statistics to learn the difference.

**e0338** ABLATION OF LEFT-VARIATED DUAL ATRIOVENTRICULAR NODAL PATHWAY IN CORONARY SINUS

doi:10.1136/hrt.2010.208967.338

1Huang Weibin, 2Hong Jiang, 3Wang Yan, 1Zhou Faguang, 1Zeng Zhaopin, 2Wang Lexin, 2Sun Baogui. 1Xi’an University Zhongshan Hospital, 2Shanghai Jiaotong University Affiliated First Peoples Hospital, 3School of Biomedical Sciences Charles Sturt University

Atrioventricular nodal reentrant tachycardia (AVNRT) is the most common paroxysmal supraventricular tachycardia. It is well accepted that the mechanism of AVNRT is reentry associated with dual or multiple atrioventricular nodal (AVN) pathway. Typical AVNRT pathways including fast and slow pathways are defined in right atrium. Radiofrequency catheter ablation slow pathway, occasionally fast pathway, has become the definitive treatment of choice for most symptomatic patients. Besides typical AVNRT, there exists some atypical AVNRT with various manifestations. Several groups have reported successful ablation of leftward dual AVN pathway in the left side of the heart. We present one case of left-variated AVN as well as dual AVN pathway. Routine ablation methods failed to eliminate the tachycardial. Detailed electrical physiological study showed that His Bundle potential was minimal recorded in the right atrium septum but was prominent when recorded in the left septum using a catheter via transaortic approach. Left varied dual AVN pathway was considered. Since routine methods were unsuccessful, an ablation was forward deep into coronary sinus when a target with A/V = 1/4 and without His bundle electrogram was mapped. A small energy attempt showed effective and the tachycardia was successfully eliminated by ablation of slow pathway deep in the coronary sinus.

**e0339** ANTERIOR SPINAL ARTERY SYNDROME DUE TO CARDIAC TAMPOONADE AFTER PERCUTANEOUS CORONARY INTERVENTION-A CASE REPORT

doi:10.1136/hrt.2010.208967.339

1Tong Hong, 2Dan Qihong, 3Chen Lei. 1Taizhou First People Hospital, 2Taizhou Center Hospital

Objective Delayed cardiac tamponade is an uncommon complication of percutaneous coronary intervention (PCI). Anterior spinal artery syndrome (ASAS) induced by cardiac arrest due to cardiac tamponade is rare. We report such a case and discussed the causes and prevention measures.

Case report This is a 78 year-old man admitted for exertion angina for 3 months. He had implanted with a VVI cardiac pacers 3 months
