**e0359 A CARDIAC SODIUM CHANNEL SCN5A SUBUNIT GENE POLYMORPHISM AND EARLY REPOLARISATION VARIANT**

doi:10.1136/hrt.2010.208967.359

Ying Gao, Ping Zhang, Ying Tian, Jinhong Guo. Beijing University People’s Hospital

**Objectives** To investigate the effect of the Polymorphism of cardiac sodium channel subunit α (SCN5A) gene on early repolarisation variant (ERV).

**Methods** Using PCR direct sequencing technology, two single nucleotide Polymorphisms (SNP) of SCN5A gene, 1673 A>G and 3666 +69 G>C 84, was analysed by detecting genetic variation genotypë and allele frequency distribution in 54 early repolarisation variant and 30 healthy subjects from the Beijing Municipal People’s Hospital of Peking University and the Sixth Hospital of Beijing.

**Results** In the 1673 A>G locus, there is no significant difference in genetic mutation as well as allele frequency distribution between variant and healthy group. In 3666 +69 G>C locus, both of genetic variation genotypë and allele frequency distribution in variant group are significantly different from control group (<0.05). In variant group, there is no statistical difference in sex, syncope and the J-wave elevation range.

**Conclusion** 3666 +69 G gene Polymorphism (G→C) may be associated with early repolarisation variant.

**e0360 THE STUDY OF THE DIAGNOSTIC VALUE FOR ISCHAEMIA MODIFIED ALBUMIN (IMA)**

doi:10.1136/hrt.2010.208967.360

Liu Zhiqin, 1Hang Shang, 1An Yapin, 1Li Jun, 2Liu Chang. 1People’s Hospital of Guizhou Province, 2Medical Doctor, Medical college of Zhejiang University

**Objective** To study the diagnostic value of ischaemia modified albumin (IMA) (IMA) for unstable angina (UA).

**Methods** The level of blood serum IMA of UA patient, stable angina (SA) patient and the non-coronary heart disease group (CHD) were detectioned by IMA reagent kit (Changsha YIKANG Technical Co. Ltd). To calculate the IMA diagnostic sensitivity, specificity positive predictive value (PPV) and negative predictive value (NPV) of UA. IMA goes by albumin cobalt binding (ACB), IMA value was denoted by ABC value. The lower ABC value was, the higher free cobaltion (Co²⁺) absorbed by albumin in 1 ml serum. The optimal cutoff point (cutoff) as distinguishing UA from The control group was obtained By receiver operating characteristic.

**Results** 1. ABC value of UA group (72 patients) was 62.80±9.56 U/ml, SA group (43 patients) was 73.86±6.43, non-CHD group (59 patients) was 76.13±7.25. The ABC value in the UA group was obviously lower than the SA group and the non-CHD group (p<0.01), but the SA group was not difference from the non-CHD group (p>0.05). The ABC value in the UA group within 6h (43 patients) were obviously lower than that in the period from 6 to 12 h (29 patients) (p<0.01), the latter was also obviously lower than the non-CHD group (p<0.01). That indicated: The level of IMA in the group of UA patients within 12 h was obviously higher than the SA group and the non-CHD group (p<0.01), which was more significantly higher within 6 h. 2. The area under curve (AUC) was 0.945, cutoff point was 66.3 U/ml, one U was defined as 1 μg Co²⁺ absorbed by albumin in 1 ml serum. The optimal cutoff point (cutoff) as distinguishing UA from The control group was obtained By receiver operating characteristic (ROC).

**Conclusion** IMA becomes possibly the sensitive biochemical marker for myocardial ischaemia and is applied diagnosing UA in the earlier period.

**e0361 EFFECT ON ELECTROLYTIC TO COMBINING APPLICATION OF CALCIUM CHANNEL BLOCKER (CCB) AND DIURETIC FOR GENERAL HYPERTENSIVES**

doi:10.1136/hrt.2010.208967.361

Xue Xiaobing, Hong Jing, Tao Sha, Li Nanfang. Hypertension Unit of The People’s Hospital of Xinjiang Uygur Autonomous Region, The Institute of Hypertension of Xinjiang, The Center of Hypertension of The People’s Hospital of Xinjiang Uygur Autonomous Region

**Introduction** To evaluate the effects of low-dose applications of dihydroulochloothyazide (DHCT) or DHCT and nitrendipine on blood pressure, heart rate, and serum electrolytes in hypertensives in Xinjiang agriculture-pasture region.

**Method** Administer low dose DHCT two weeks of hypertensive disease in basic level region, according to blood pressure reach standard, combining nitrendipine (68 subjects), keep on low dose DHCT (67 subjects), follow-up visit for 3 months, to observe change of electrolytic and blood pressure (BP), heart rate (HR).

**Result** BF and HR decreased significantly after antihypertensive drug therapy compared with the baseline level each regimen (<0.05). According to the post-treatment by trimenon, Blood sodium of each regimen after antihypertensive drug therapy was lower than that before antihypertensive drug therapy, p<0.05. There were no statistical differences in changes of electrolytic (Na⁺, K⁺ and Ca²⁺)between two regimens, p>0.05.

**Conclusion** They can lead to hypotension low dose regimen of DHCT and combinant nitrendipine towards to hypertensive disease in basic level region. But on the basis of low dose regimen of DHCT combining nitrendipine is not to further increase the electrolytic turbulence.

**e0362 CORRELATION BETWEEN ATHEROSCLEROTIC PLAQUES MORPHOLOGY AND SEROUS HYPERSENSITIVE C-REACTIVE PROTEIN IN PATIENTS WITH PREMATURE CORONARY HEART DISEASE**

doi:10.1136/hrt.2010.208967.362

Lijian Gao, Jue Chen, Jilin Chen, Juejin Yang, Shubin Qiao, Bo Xu, Jianjun Li, Xuewen Qin, Min Yao, Yongjian Wu, Jingjing Yuan, Shijie You, Yu Chen, Jun Dai, Jie Qian, Runlin Gao. Fuwai Hospital

**Objectives** To investigate the relationship between intravascular ultrasound (IVUS) imaging characteristics and plasma hypersensitive C-reaction protein of premature coronary heart disease (CHD).

**Methods** Comparative study was conducted on 57 premature CHD and 57 late CHD patients whose data were intact and could be analysed, and the clinical follow-up was completed at 12 months after the procedure.

**Results** Comparison between premature CHD patients and late CHD patients, the ratio of lipid core measured by IVUS to plaque of coronary artery was in linear relationship with plasma hypersensitive CRP in premature CHD patients (p<0.001). We found that the former has more patients with family history of CHD, smoking, myocardial infarction, hyperlipaemia and unstable angina pectoris (all the p value <0.05), while the latter has more patients with diabetes. There was no difference between the two groups on the morphology of the lesions by coronary artery angiography. But lesion extent, cross-sectional areas surrounded by external elastic membrane, eccentricity index (EI), plaque plus medial area (MA), positive remodelling, plaque burden and the ratio of lipid core to plaque by IVUS were usually seen in the former group (all the p value <0.05). There was no difference on major adverse cardiac events (MACE) rate between the two groups at 12-month clinical follow-up. The MACE rate was 7.89% (9/114). Three and four patients suffered from TVR or TLR and two patients died. There was only 1 patient died from late stent thrombosis in the two groups (0.87%).
