coronary arteries were assessed by Gensini scoring system. The fasting serum concentrations of CatS and CysC were measured before angiography respectively. The SPSS11.0 system was applied to analyse the data. Compared with controls, serum levels of cathepsin S in CAD groups increased significantly and demonstrated positive correlation (r=0.69, p<0.0001) with Gensini score. After being corrected for other common factors (age, sex, blood pressure and blood lipid, etc) by multivariate stepwise regression analysis, this relationship also existed.

**Conclusions**  Serum levels of cathepsin S are associated with severity of athero sclerotic lesions of coronary arteries. The higher serum levels of cathepsin S are, the severer atherosclerotic lesions of coronary arteries are.

**e0396 CLINICAL ANALYSIS OF 30 INDIVIDUALS WITH MICRO CK TYPE 1**

doi:10.1136/hrt.2010.208967.396

Zhi-Yuan Dong, Zhi-kai Wang, Ji-Yong Liu, Xiao-Bin Tang, Li-Mei Wang, Lian-Yi Sh., Yuan-Ying Liu, Xu-Zhen Zhao. Healthcare Center, The Central Hospital of CNPC, Langfang

**Objective**  The aim of the prospective study was to investigate the clinical and laboratory features of individuals with micro creatine kinase type 1 (MCK-1), and to evaluate the clinical significance of these cases who expressed serum MCK-1.

**Methods**  To screen MCK-I individuals from serum samples in our biochemistry laboratory from April 2002 to April 2010 according to both increasing CK-MB activity and CK-MB/CKRatio over 25%, and finally confirmed by agarose gel electrophoresis of CK isoenzyme analysis. To analyse the clinical and laboratory data of individuals who expressed serum MCK-I isoenzyme.

**Results**  MCK-I was detected in the samples in 30 subjects. Their mean age at the initial presentation was 58.6 years (range 26 to 81), 65.3% were female (n=19), and 39.3% (n=11) had hypertension. Of the 30 subjects, 10 (33.3%) had increased total CK activity, and 7 (23.3%) showed the abnormal phenomenon that CK-MB:CK ratio was >1. Our study indicated that the misdiagnostic rate was 40.0% (n=12), and the rate of missed diagnosis was 46.7% (n=14). There were 3 deaths during the follow-up period.

**Conclusion**  MCK-1 was not rare in clinical practice. Among the conditions in which CK-MB activity is elevated in the absence of myocardial injury or infarction using immunoinhibition methods, MCK-I merits special attention from clinicians. CK-MB index is a simple and rapid screening test for MCK-I.

**A CORRELATIONAL STUDY OF ACE GENE POLYMORPHISMS AND RISK FACTOR WITH CORONARY HEART DISEASE IN HAINAN LI AND HAN NATIONALITY**

doi:10.1136/hrt.2010.208967.397

Yun Meiling, Zheng Yin, Zhong Jianghua, Zeng Yu, Li Tianfa, Wang Zhen. 1Affiliated Hospital, Hainan Medical College; 2Hainan Provincial Peoples Hospital; 3Affiliated Hospital Hainan Medical College; 4Hainan Province Diseases of The Aged Hospital

**Objective**  To study the correlation of the ACE gene polymorphisms with coronary heart disease (CHD) in the Hainan Li nationality.

**Methods**  Used the PCR to detect the polymorphisms of ACE gene insertion/deletion (I/D) in 150 patients with CHD and 150 healthy people from Hainan Li and Han nationality. The genotype frequencies and allele frequencies of DD, DI and II were 24.7%, 32.7%, 42.6% respectively, and the allele frequencies of D and I were 41.0% and 59.0%. In the healthy control of Hainan Li nationality, the genotype frequencies of DD, DI and II were 14.0%, 44.0%, 42.0% respectively, and the allele frequencies of D and I were 36.0% and 64.0%. There were significant differences both in the genotype frequencies of DD, DI and II, and in allele frequencies D and I between these two groups (p<0.05). There were no significant differences in the sex, the blood pressure, the body mass index (BMI), the total serum cholesterol (TC) and the low density lipoprotein cholesterol (LDL-C) level between these two groups (p>0.05). There was significant differences in the sex between these two groups (p<0.05). The triglyceride (TG) level in the CHD group was significantly higher than in the control (p<0.05). The high density lipoprotein cholesterol (HDL-C) level in the CHD group was significantly lower than the control (p<0.05).

**Conclusions**  There were notable correlation between the ACE gene I/D polymorphisms and the CHD in Hainan Li nationality. The ACE gene polymorphisms are the major gene that causes CHD in Hainan Li nationality. It may be the independent risk factor in CHD in Hainan Li nationality. So it is very important to intervene with ACEI inhibitors or angiotensin receptor blockers (ARB) in the early stage of CHD.
CHD in Hainan Li and Han nationality. The higher TG level and the lower HDL-C level may be the risk factor in Hainan Li and Han nationality.

**e0399 THE ACE GENE POLYMORPHISMS DISTRIBUTION STATUS IN HAINAN LI AND HAN PEOPLES WITH CORONARY HEART DISEASE**

doi:10.1136/hrt.2010.208967.399

Yun Meiling, Zhong Janghua, Zheng Yin, Zeng Yu, Tianfa, Zhang Yong, Hainan Medical College; Affiliated Hospital, Hainan Medical College; Hainan Provincial Peoples Hospital; Hainan Province Diseases of The Aged Hospital

**Objective** To explore the significance of the ACE gene insertion/deletion (I/D) polymorphism in peoples of Hainan Li and Han nationality with coronary heart disease (CHD).

**Methods** Used the PCR to detect the polymorphisms of ACE gene insertion/deletion (I/D) in 150 patients with CHD and 150 healthy people from Hainan Han and Li nationality respectively. Observed the genotype frequencies and allele frequencies of DD, DI and II. Specific PCR detection was performed for patients who have been determined as DD by normal PCR to reduce misclassification rate. Meanwhile detected the blood lipid, the lipoprotein, the blood pressure, the blood sugar in all people. Used the multiple regression analysis to find out the risk factor in CHD patients.

**Results** The genotype frequencies of DD in the CHD group of Han and Li nationality are significantly higher than the control group of Han and Li (p<0.05). There were no significant differences in the genotype frequencies of DD, DI and II between the Han and Li with CHD. By the multiple regression analysis it shows: the genotype frequencies of DD, DI and II in the CHD group of Han and Li nationality increased, the high density lipoprotein cholesterol (HDL-C) level in the CHD group of Han and Li nationality decreased. The triglyceride (TG) level in the CHD group of Han nationality increased.

**Conclusions** The genotype frequencies of DD are associated with CHD. The susceptibility of CHD in Han and Li nationality is the same. Increasing the HDL-C level can protect the CHD patients. The high level of TG is the independent risk factor in Hainan Han people with CHD.

**e0400 MOBILISE AUTOLOGOUS BONE MARROW STEM CELLS TO REPAIR INFARCTED MYOCARDIUM**

doi:10.1136/hrt.2010.208967.400

Bo Wang, Xiaojuan Bai, The First Affiliated hospital of China Medical University

**Objective** Autologous bone marrow stem cells were mobilised and released by cytokines. On the basis of homing and injured micro-environment theories, we investigated the effective reparation of situ transplantation for acute myocardial infarction in rats.

**Methods** (1) We divided 60 Wistar rats into situ transplantation group and control group. To duplicate rat's acute myocardial infarction model by injection of drug; CK, LDH level were checked by automatic biochemistry analyser; (2) 30 Wistar rats were injected rhG-CSF 50 μg/kg/day; (3) We did a control analysis on pathological section between two groups by histological staining technique and computer graphic analysis; (4) Heart function were checked by polygraph system after AMI model 4 weeks.

**Results** (1) Serum cardiac enzymes were higher after AMI model 48 h than it before AMI model. We saw local necrosis region with grid and trabs shape in endocardium of left ventricular apex and papillary muscle; (2) The infarction size in situ transplantation group was smaller than one in control group; (3) The heart function parameters improved significantly in situ transplantation group compared with control group.

**Conclusions** (1) Rat's acute myocardial infarction model could be completed by injecting 10 mg/kg isoprenaline interaperitoneally; (2) Infarcted myocardium were repaired and heart function improved by using cytokines.

**e0401 CHANGES OF INTRACELLULAR CALCIUM CONCENTRATION IN CARDIAC-LIKE MYOCYTES**

doi:10.1136/hrt.2010.208967.401

Wang bo, Bai xiaojuan. The First Affiliated hospital of China Medical University

**Objective** To study the effects of verapamil, endothelin on [Ca2+], in cardiac-like myocytes derived of bone marrow mesenchymal stem cells.

**Methods** (1) Bone marrow mesenchymal stem cells and cardiac myocytes were cultured by primary method; (2) Bone marrow mesenchymal stem cells differentiated into cardiac-like myocytes by S-azacytidine induction agent; (3) We divide our test into three groups, including the first generation bone marrow mesenchymal stem cells, cardiac-like myocytes and cardiac myocytes; (4) The alteration of [Ca2+]i, affected by verapamil, endothelins was observed with [Ca2+]i fluorescence image system.

**Results** (1) Cardiac myocytes were set up through trypsojen digestion method; (2) The alteration of [Ca2+]i, affected by verapamil was observed with [Ca2+]i fluorescence image system. There was a same trend of variability between cardiac-like myocytes and cardiac myocytes, but no changes in bone marrow mesenchymal stem cells; (5) The alteration of [Ca2+]i, affected by endothein was observed with [Ca2+]i fluorescence image system. There was a same trend of variability that fluorescence intensity gradually strengthened with intervention time extended.

**Conclusions** After affected by verapamil and endothelins, there was a same trend of [Ca2+]i changes between cardiac-like myocytes from bone marrow mesenchymal stem cells and cardiac myocytes. It shows that some common electrophysiological characteristics exist in cardiac-like myocytes and cardioayocytes.

**e0402 THE EXPRESSION AND RELATION OF THE VITAMIN D3 UP-REGULATED PROTEIN 1 IN PERIPHERAL BLOOD MONONUCLEAR CELLS FROM PATIENTS WITH CORONARY ARTERY DISEASE**

doi:10.1136/hrt.2010.208967.402

Shui Xing, Wu Zhen, The Third Affiliated Hospital of Sun Yat-sen University

**Aims** Vitamin D3 up-regulated protein 1(VDUP1) is a stress-response gene and participates in oxidative stress, inflammation, apoptosis, proliferation, glucose homeostasis and lipid metabolism. All of these biological effects play important roles in atherosclerosis. Hence, we made an attempt to study the gene expression of VDUP1 using PBMCs from patients with coronary artery disease (CAD).

**Methods** The total RNA of PBMCs were acquired from 20 normal persons without history of cardiovascular disease and 72 patients with CAD. The CAD group was divided into 6 subgroups judged by following risk factor. The subgroup 1 was patient without hyperlipidaemia, hypertension and diabetes. The subgroup 2 was patient with hypertension only. The subgroup 3 was patient with hyperlipidaemia only. The subgroup 4 was patient with diabetes only. The subgroup 5 was patient with hyperlipidaemia plus hypertension.
