MATRIX METALLOPROTEINASES-9 — A BIOMARKER IN AORTIC DISSECTION

Conclusions

Aortic dissection (AD) is a life threatening emergency. Early diagnosis and treatment are pivotal for patients with AD. Matrix metalloproteinases (MMPs), through degradation of extracellular matrix, may play an important role in these processes. Elevation of MMPs might represent an opportunity to diagnostically characterise acute aortic processes. We examined the potential diagnostic role of MMP-9 in AD.

Methods

Between February 2009 and November 2009, 86 consecutive patients affected by acute AD who were admitted to our emergency department for evaluation were enrolled in this study (Traumatic AD, Marfan Syndrome were excluded). Blood samples were obtained from venipuncture in EDTA tubes from fasting patients at the time of hospital admission. Plasma levels of MMPs were evaluated by ELISA in 86 patients affected by AD (26 type A, 58 type B). 30 healthy subjects were used as controls. Aortic tissue samples obtained during surgery were evaluated by immunohistochemistry and western blot for MMP-9 expression. In addition, control tissue was obtained from subjects who underwent heart transplantation (2 male and 1 female). Data were analysed by SPSS statistical software (version 13.0). All data were presented as mean ± SEM. A two-tailed unpaired Student t test was used to assess differences in MMP levels. p < 0.05 was considered statistically significant.

Results

Mean plasma values for MMP-9 were higher in patients affected by AD compared to control group at the time of hospital admission (22.78 ± 1.28 ng/ml vs. 17.45 ± 1.36 ng/ml; p < 0.05). Moderate/strong expression (+ + +/+ + +) of MMP-9 was present in both the intima and media layers at the entry site in AD compared to control aortas, Western blot analysis confirmed the expression of MMP-9 in AD whereas no/low (−/+) expression was present in control aortas.

Conclusions

This pilot study suggests that MMPs play an important role in the pathophysiology of AD and that the acute phase of AD is characterized by an increase of MMP-9 plasma levels. Further investigation of MMPs and their inhibitors in AD will likely lead to advancements in the diagnosis, prognosis, and treatment of this deadly disease.
developed pressure (LVDP), the maximum change rate of left ventricular pressure rise and fall (±dp/dtmax) were recorded. The activity of creatine kinase (CK) in coronary outflow, the activity of malonyldialdehyde (MDA) and superoxide dismutase (SOD) in myocardium were detected. The percentage of necrotic area were observed.

Results In adult rats, the content of CK (89.48±18.72 U/l vs 115.76±16.72 U/l, p<0.01) and MDA (5.95±3.44 nmol/mg vs 16.84±2.29 nmol/mg, p<0.01) were significantly less in IPC group than those in I/R group. In IPC group, the activity of SOD (584.7±122.62 U/mg vs 429.46±55.24 U/mg, the recovery rate of the left ventricular function, including CO, LVDP and ±dp/dtmax, were much higher than those in I/R group (78.69±9.68% vs 65.10±5.63%, 83.61±3.46% vs 67.23±2.66%, 81.65±5.68% vs 67.89±6.89%, 89.79±7.78% vs 66.79±3.46%, p<0.01). And the percentage of necrotic area were lower in adult IPC group than in I/R group (5.25±4.33 vs 14.75±8.02, p<0.01). But there were no significant changes between IPC group and I/R group in elderly rats (p>0.05). However, there were great significant changes between enhanced IPC group and IR group in elderly rats, the content of CK (58.60±28.32 U/l vs 105.76±9.64 U/l, p<0.01) and MDA (5.38±3.56 nmol/mg vs 16.80±5.06 nmol/mg, p<0.05), the activity of SOD (558.87±122.62 U/mg vs 429.46±55.24 U/mg, p<0.01), the recovery rate of the left ventricular function, such as CO, LVDP and ±dp/dtmax, were much higher than those in I/R group (77.99±10.02% vs 66.26±9.78%, 85.59±6.67% vs 73.90±6.68%, 83.87±9.92% vs 68.90±6.68%, 86.01±7.66% vs 70.39±7.98%, p<0.01). The percentage of necrotic area were lower in elderly IPC group than in I/R group (7.95±6.32% vs 15.62±10.56%, p<0.01).

Conclusion The effect of IPC on ischaemic reperfused myocardium of elderly rats was weaken. Prolonged ischaemia was able to resume the protective effect of IPC on elderly rat hearts.

**TONGXINLIOU REDUCES MYOCARDIAL ISCHAEMIA-REFUSION INJURY AND NO-REFLOW BY STIMULATING THE EXPRESSION AND PHOSPHORYLATION OF ENOS VIA PKA PATHWAY**

doi:10.1136/hrt.2010.209867.16

Objective To investigate whether oral administration of T Tongxinluo (TXL), a traditional Chinese medicine, at a single low loading dose 1 h before myocardial ischaemia reduces myocardial no-reflow and ischaemia-refusion injury by upregulating the expression of eNOS and p-eNOS (Ser 1179 and Ser 635), and this effect is partially mediated by PKA pathway.

**EFFECTS OF EXTRACORPOREAL CARDIAC SHOCK WAVE THERAPY ON ANGIOGENESIS AND EXPRESSION OF VEGF IN ACUTE MYOCARDIAL INFARCTION PIGS**

doi:10.1136/hrt.2010.208967.17

1Siming Tao, 2Tao Guo, 3Yu Wang, 3Hongyan Cai, 2Chao Yang. 1The No.2 Peoples’ Hospital of Yunnan Province; 2The No.1 Hospital Affiliated To Kunming Medical College

Objective To investigate the effect of different methods of extracorporeal cardiac shock wave therapy on angiogenesis and expression of VEGF in acute myocardial infarction pigs, and optimise that of methodology.

Methods 25 miniature swine were randomly divided into three groups: group of cardiac shock wave therapy (n=15), positive control group (n=5), negative control group (n=5). According to the method, the animals of cardiac shock wave therapy were divided three subgroups: standard, prolonged course of treatment and extend area. The number of capillary density, mRNA of VEGF were evaluated and compared between with every group.

Results Compared with control positive group, the number of capillary density (837±54 vs 1856±78, p<0.0001) and expression mRNA of VEGF (20.52±4.94 vs 28.56±8.84) increased in the group of cardiac shock wave therapy, especially, in group of prolonged course of treatment. Whereas, there was no significance in the difference of between standard group and extend area group in capillary density (1653±24 vs 1695±52 mm², p<0.05) and mRNA of VEGF (26.31±7.24 vs 27.44±3.59, p>0.05).

Conclusions Successive extracorporeal cardiac shock wave therapy at early stage of acute myocardial infarction could improve myocardial micro-vascular circulation. It will be a new and non-invasive angiogenic therapy.

**VAGUS NERVE-MEDIATED ELECTRICAL REMODELLING OF PULMONARY VEINS IN CHRONIC ATRIAL PACING DOGS WITH OR WITHOUT SUPERIOR VENA CAVA AND AORTIC ROOT FAT PAD**

doi:10.1136/hrt.2010.209867.18

Xiong Rixin.

Objectives We aim to elucidate the relationship between vagus nerve and the electrical remodelling of pulmonary veins in vagus nerve-mediated atrial fibrillation dogs.

Methods 24 adult mongrel dogs weighing 15–20 Kg were randomly divided into sham operation group (3 group, n=8), SVC-Ao fat pad removal group (R group, n=8) and SVC-Ao fat pad reserved group (Re group, n=8). After exposure of superior vena cava and aortic root fat pad, SVC-Ao fat pad was excised in R group dogs, and sewed epicardial pacing lead into high right atrium and successively paced for 6 weeks; for Re group dogs, suture of epicardial pacing leads and pace for 6 weeks, take the sham operation dogs as control. To detect the Left Superior Pulmonary Vein, Right Superior Pulmonary Vein, Left Inferior Pulmonary Vein, Right Inferior Pulmonary Vein respectively, including Sinus Cycle Length (SCL), Effective Refractory Period (ERP), dispersion of ERP (dERP), and the expression of Cx40 and Cx43 by Western Blot, observed the distribution of gap junctions at pulmonary vein sleeves by immunofluorescence and electron microscope.
