elucidate the signalling pathway involving in heart remodelling of cTnI<sup>R146W</sup> +/- mice.

**Methods** Cardiac hypertrophy-related signalling pathway protein, such as calcineurin, calcsarcin-1, GSK-3β, AKT, SERCA2, PLB were detected by Western blot and RT-PCR. We also assessed the activity of calcineurin in cTnI<sup>R146W</sup> +/- mice, in order to elucidate potential mechanisms involving in the cardiac remodelling in cTnI<sup>R146W</sup> +/- mice.

**Results** The total expression of cTnI in cTnI<sup>R146W</sup> +/- mice was significantly higher than that of cTnI<sup>R146W</sup> +/- mice (p<0.05), while the phosphorylation of cTnI decreased significantly (p<0.05), resulting in a obvious decrease of the ratio of phos-cTnI to cTnI (p<0.05).

Pathological changes such as myocardial cell proliferation, cardiac hypertrophy, and interstitial fibrosis were observed by optical microscope in cTnI<sup>R146W</sup> +/- mice. Markers of cardiac hypertrophy, such as ANF, BNP, β-MHC increased significantly in cTnI<sup>R146W</sup> +/- mice (p<0.05). The expression of calcineurin-1 in cTnI<sup>R146W</sup> +/- mice was significantly higher than that of cTnI<sup>R146W</sup> +/- mice (p<0.01), while other cardiac hypertrophy-related signalling pathway protein, such as calcineurin, GSK-3β, AKT, SERCA2 did not change. The mRNA expression of PLB was reduced significantly by RT-PCR (p<0.05). Meanwhile, the calcineurin activity of cTnI<sup>R146W</sup> +/- mice increased significantly (p<0.01).

**Conclusion** cTnI<sup>R146W</sup> +/- mice had typical pathological cardiac remodelling and heart dysfunction, especially in the older ones. The expression of calcineurin-1 and the activity of calcineurin-NFAT signalling pathway may be the most important mechanism involving in pathological cardiac hypertrophy in cTnI<sup>R146W</sup> +/- mice.

**PERSIMMON PEEL IMPROVED DYSLIPIDEMIA AND ITS RELATED PRODUCTION OF Atherogenic AUTOANTIGEN COMPLEXES IN LOW-DENSITY LIPOPROTEIN RECEPTOR-DEFICIENT MICE**

QIAN Nanhu, Yang Zheng. First Affiliated Hospital of Jilin University, Changchun, China

**Objective** Roles of persimmon peel were investigated on possibility of developing atherosclerosis in low-density lipoprotein receptor (LDLR)-deficient mice in view of lipid metabolism, physico-biological oxidation, production of its related atherogenic autoantigen, and anti-atherogenic natural antibody production.

**Method** Male LDLR-deficient mice fed a high fat diet or a high fat diet supplemented with 10% dried and powdered persimmon peel (PP) for 12 weeks.

**Result** The PP supplementation significantly reduced the increment of plasma cholesterol and triglyceride levels. The high fat diet feeding increased plasma level of oxidised LDL/b2-glycoprotein 1 (oxLDL/b2GPI) complexes as an atherogenic autoantigen, and anti-atherogenic natural antibody production.

**Conclusion** Thus, these results demonstrate that persimmon peel may have an anti-atherogenic property through normalisation of lipid metabolism and may be able to reduce production of the atherogenic complexes.

**EFFECTS OF MESENCHYAML STEM CELLS ON MATRIX METALLOPROTEINASE SYNTHESIS OF CARDIAC FIBROBLASTS**

Ya-Ping Wang, Xin-Yang Hu, Xiao-Jie Xie, Jian-An Wang. Second Affiliated Hospital Zhejiang University College of Medicine, Hangzhou, China

**Objectives** Mesenchymal stem cell (MSC) transplantation has been known to decrease matrix metalloproteinase (MMP) synthesis in the myocardium after myocardial infarction (MI) and to improve ventricular remodelling. However, the underlying mechanisms behind MSC have not been clearly demonstrated yet. This study investigated the effects of MSCs through paracrine actions on the MMP synthesis of cardiac fibroblasts (CFs).

**Methods** CFs were placed under hypoxia conditions for 24 h before co-culture with MSCs or hypoxia preconditioning MSCs (HP-MSCs) in transwells. CFs and MSCs/HP-MSCs shared the same medium, in which erythropoietin (EPO) antibody and EPO receptor (EPOR) were/were not added. Gelatin Zymography was used to detect the gelatinolytic activity of matrix metalloproteinase-2 (MMP-2) and matrix metalloproteinase-9 (MMP-9) in culture media of CFs with different conditions. Western-Blotting was used to assay MMP-2, MMP-9 and TIMP-1 synthesis of CFs. The ERK1/2 signalling pathway was also investigated.

**Results** Protein expression and activity of MMP-2 produced by CFs significantly increased by about 1.4-fold (p<0.01) through hypoxia and decreased after co-culture with MSCs or H-MSCs. This is not the case with MMP-9. Mediation of effects may involve phosphorylation of ERK1/2. Tissue inhibitors of metalloproteinases-1 (TIMP-1) had reverse effects on regulation of MMP-2. Either exogenous EPOAb or EPOsR partially inhibited MSCs effect on MMP-2 protein expression and activity by CFs.

**Conclusions** MSCs may influence MMP/TIMP expression by CFs via the ERK1/2 pathway and EPO may acts as a key factor in the paracrine actions of MSCs.

**HEAT SHOCK PROTEIN 90 PROTECTS RAT MESENCHYMAL STEM CELLS AGAINST HYPOXIA AND SERUM DEPRIVATION-INDUCED APOPTOSIS VIA PI3K AKT AND ERK12 PATHWAYS**

Gao Feng, Hu Xinyang, Xie Xiaojia, Xu Ouyuan, Wang Yaping, Liu Xianbao, Xiang Meixiang, Sun Yong, Wang Jian-an. Second Affiliated Hospital Zhejiang University College of Medicine, Hangzhou, China

**Objective** Mesenchymal stem cells (MSCs) transplantation has shown therapeutic potential to repair the ischaemic and infarcted myocardium, but the effects are limited by apoptosis and loss of donor cells in host cardiac microenvironment. The aim of this study is to explore the cytprotection of Hsp90 against hypoxia and serum deprivation induced apoptosis and the possible mechanisms.

**Methods** Cell viability was determined by 3-(4.5-dimethylthiazol-2-yl)-2, 5-diphenyltetrazolium bromide assay. Apoptosis was assessed by Annexin V/PI staining. The gene expression of TLR4 and ErbB2 was detected by real-time PCR. The protein levels of cleaved-caspase3, bcl-2, bcl-xl, bax, total-Erk, phospho-Erk, total-Akt, phospho-Akt and hsp90 were detected by western-blot. The production of nitric oxide was measured by spectrophotometric assay.

**Results** Hsp90 improves MSCs viability and protects MSCs against apoptosis induced by serum deprivation and hypoxia. The
The protective role of Hsp90 not only elevates bcl-2/bax and bcl-xl/bax expression but also decrease cleaved-caspase3 expression via down-regulating TLR-4 and ErbB2 membrane receptors. By binding to TLR-4 and ErbB2, Hsp90 activates the PI3K/Akt and ERK1/2 pathways. Hsp90 also down regulates the pro-apoptotic protein bax. It is demonstrated that exogenous Hsp90 elevates the expression levels of bcl-2/bax and bcl-xl/bax by activating the TLR-4 and ErbB2 downstream PI3K/Akt and ERK1/2 pathways, which decreases cleaved caspase-3.

Conclusion Hsp90 significantly protects MSCs against apoptosis induced by hypoxia and serum deprivation. These findings demonstrates a novel and effective treatment strategy against MSC apoptosis in cell transplantation.

**EFFECTS OF RANOLAZINE ON ACTION POTENTIAL AND CONTRACTION FORCE IN GUINEA PIG PAPILLARY MUSCLES**

doi:10.1136/hrt.2010.208967.202

Guotao Wang, Ping Yang. Department of Cardiology, China-Japan Union Hospital of Jilin University, Changchun, China

**Objective** To observe the effects of ranolazine on the action potential and contraction force in guinea pig papillary muscles. To explore the mechanism of ranolazine anti-arrhythmia and myocardial ischaemia.

**Methods** 18 healthy adult guinea-pigs were randomly divided into H2O2 (200 mmol/l) groups, ranolazine (10 mmol/l) +H2O2 groups and TTX (2 mmol/l) + H2O2 groups, with six guinea pigs in each group compared before and after administration to observe the effects of ranolazine on the papillary muscles.

**Results** H2O2 could increase action potential durations measured at 50% repolar...morezation levels and 90% repolarisation levels were prolonged (p<0.001). There was reduced myocardial contractility (p<0.05) in contraction force in the guinea pigs compared to before administration. Ranolazine can inhibit action potential durations measured at the 50% repolar...morezation levels and the 90% repolarisation levels were prolonged by H2O2, but the effect was weaker compared to that of TTX. Ranolazine and TTX could improve myocardial contractile force by reducing the H2O2-induced. Ranolazine could reduce action potential duration the H2O2-induced and increase contraction force. TTX performs a similar role.

**HEAT SHOCK PROTEIN 90 ENHANCES RAT MESENCHYMAL STEM CELLS MIGRATION VIA PI3KAKT AND ERK12 PATHWAYS**

doi:10.1136/hrt.2010.208967.204

Gao Feng, Hu Xinyang, Xie Xiaojie, Xu Qiyuan, Wang Yaping, Liu Xianbao, Wu Rongrong, Xiang Meixiang, Sun Yong, Wang Jian-an. Second Affiliated Hospital, Zhejiang University College of Medicine, Hangzhou, China

**Objective** Heat shock protein 90 (HSP90) is a chaperone for several client proteins involved in transcriptional regulation, signal transduction, and cell cycle control. HSP90 is abundantly expressed by a variety of tumour types and has been recently targeted for cancer therapy. The objective of this study is to determine the role of Hsp90 in regulating the migration of Mesenchymal stem cells and to determine the mechanism. We hypothesised that inhibition of Hsp90 impairs the MSCs migration via PI3K/Akt and ERK12 signalling pathways.

**Methods** The MSCs were cultured from femoral and tibia. The ability for MSCs cells to migrate is to be determined by the wound healing assay and transwell assay. The activity of matrix metalloproteinase-2 (MMP-2) and matrix metalloproteinase-9 (MMP-9) were estimated by gelatin –zymography. The mRNA levels of MMP-2, MMP-9, CXCR4 and VCAM-1 were detected by real-time PCR. The protein expression of MMP-2, MMP-9 and ERK1/2, phospho-ERK1/2, Akt and phospho-Akt were determined by Western-blot.

**Results** Treatment with RhHsp90α significantly enhances MSCs migration from 9.83±2.48 to 48.65±5.81 cells. Treatment with sursp90α significantly decreased MSCs migration compared with treatment of hsp90α from 66.33±9.61 to 13.00±4.38 cells. Pretreat with 17-AAG, wortmannin, U0126, decreased MSCs migration to 13.33±1.29, 15.53±2.1, 16.5±5.3 cells, respectively. Treatment with RhHsp90α enhanced the MSCs secretion of MMP-2 and MMP-9, as well as significantly increasing the activity of MMP-9, and increasing the expression of CXCR4 and VCAM-1. PI3K/Akt and ERK signalling pathways mediate the promotion of MSCs migration by RhHsp90α.
