Conclusions This study provide strong evidence that MSCs implantation ameliorates interstitial fibrosis and the remodelling of gap junction and Kv4.2 expression, attenuates focal heterogeneity of repolarisation and conduction and reduces vulnerability to VTs. These results suggest that MSC transplantation might be emerge as a new preventive strategy against VAs besides improving cardiac performance in ischaemic heart disease.

Objective To evaluate the risk of ventricular arrhythmias (VAs) after MSC transplantation in swine model with acute myocardial infarction.

Methods Swine models with myocardial infarction were created by intracoronary balloon occlusion and then received MSC solution or 0.9% sodium chloride solution via balloon catheter. 6 weeks after artery occlusion, heart rate turbulence (HRT), dispersion of APD and RT (APDd and RTd), slope of APD reconstitution curve, Threshold cycle length of APD alternan and cardiac electrophysiologic study (EPS) were used to evaluated the VAs risks. Haemodynamic study was assessed to evaluate the cardiac performances. The concentrations of collagen in non-infarcted myocardium was assayed to elucidate the degree of myocardial remodelling.

Results There were significantly abnormality of turbulence onset (TO) and turbulence slope (TS) in MI group relative to control group (p<0.01). MSC transplantation could ameliorate the abnormal HRT (MSC group vs MI group, p<0.01). The values of APD90, APDd, RT and RTd in the MI and MSC group markedly increased compared with the control group (p<0.01). These parameters in the MSC group were significantly lower than MI group (p<0.05). The slope of reconstitution curve in the MSC group was higher than control group but lower than MI group. The threshold cycle length of APD alternan in the MSC group was remarkably lower than that in the control group (p<0.01) and lower than that in the MI group (p<0.05). Inducible malignant VAs in the MSC group were remarkable lower than that in the MI group (30.8% vs 70.0%). MSCs therapy markedly improve impaired cardiac performances and reduce fibrosis deposition after MI.

Conclusions MSC intracoronary infusion does not cause proarrhythmic risk but tent to reduce the risk of malignant VAs. MSC therapy might be emerge as a new, safe and effective preventive strategy against VAs besides improving cardiac performance in ischaemic heart disease.

Objective To evaluate the transfection efficiency of recombinant adeno- associated virus serotype 9 carrying enhanced green fluorescent protein (rAAV9-eGFP) to mouse heart in vivo and the effects on cardiac function.

Methods 1. 16 C57BL/6 mice were transected rAAV9-eGFP by tail injection. EGFP expression in the heart, liver, lung, kidney and brain cryosections was observed under inverted fluorescence microscope 7, 14, 21, 28 days after the injection of rAAV9-eGFP and eGFP was quantitated by Western Blot. 2. 20 C57BL/6 mice were divided into control group and rAAV9-eGFP group randomly, and were received with saline or rAAV9-eGFP. The echocardiography and haemodynamics were performed 28 days after the injection of saline or rAAV9-eGFP.

Results 1. EGFP expression in the heart reached the maximum at day 21, at the point of which the transduction efficiency of rAAV9- eGFP in myocardium was 52%. The other tissues had a little or no eGFP expression. 2. The cardiac function did not reveal significant difference between rAAV9-eGFP group and the control group after transfection (p>0.05).

Conclusions rAAV9-eGFP gene can be stably and efficiently expressed in mouse heart, and has no toxic effect on cardiac function.

Objective Using intravenous injection of adeno-associated virus serotypes 9 carrying ribozyme gene (AAV9-R65), we examined whether inhibition NF-κB would prevent post-infarct left ventricular rupture and remodelling in aged mice.

Methods and results Old (18-month-old) C57BL/6 male mice were given AAV9-R65 by tail vein injection 16 days before operation (MI+R65). Myocardial infarction was induced by ligation of the left coronary artery in MI+R65 group and myocardial infarction (MI) group mice. NF-κB activity was inhibited in MI+R65 mice. Inhibition of NF-κB reduced cardiac rupture in MI+R65 group (15.2% vs 32.8%, p=0.018). Echocardiographic measurements revealed that diameter of LV was significantly decreased, and ventricular wall thickness, fraction shortening were significantly increased in MI+R65 mice compared with MI mice (p<0.05). MMP-9 and TNF-α were decreased in MI+R65 group (p<0.05). And collagen was also decreased in MI+R65 group (p<0.05). But there were no changes of IL-1β in MI+R65 group.

Conclusions Cardiac rupture and remodelling were attenuated in aged mice by ribozyme gene transfer with adeno-associated virus serotypes 9. It may be caused by decreased collagen as the result of decreased MMP-9, TNF-α which proved that NF-κB signal pathway may be associated with cardiac rupture and remodelling in aged mice.

Objective Ascorbic acid has been reported to promote the differentiation of embryonic stem cells (ESCs) into cardiomyocytes (CMs). However, appropriate culture protocols are needed to improve the differentiation efficiency and produce adequate
numbers of CMs for therapeutic cell transplantation. This study investigated the effect of co-culturing with native CMs on ascorbic acid-induced cardiomyogenic differentiation in embryonic stem cells, to develop a novel protocol for generating functional CMs from ESCs.

**Methods** Native CMs were isolated from the hearts of 1-day-old Sprague-Dawley rats. Mouse ESCs were cultured in hanging drops to form embryoid bodies (EBs) and treated with or without 0.1 mM of ascorbic acid (Sigma) for cardiomyogenic differentiation. They were divided into four groups: ascorbic acid & co-culture group, co-culture group, ascorbic acid group, and control group. In the co-culture system, EBs were co-cultured with native CMs by the hanging cell culture inserts (PET 1 μm) (Millicell; Millipore, Bedford, MA, USA). The native CMs were purposely placed on culture plate inserts to prevent direct contact with subnatant EBs. Both the ESCs and native CMs grew in the same medium but they were easy to separate. The structural and functional properties of ESC-derived CMs (ESC-Ms) were evaluated by microscopic observation, immunochemistry, RT-PCR, and transmission electron microscopy.

**Results** The average percentages of EBs exhibited rhythmic contractions in co-culture and ascorbic acid group, co-culture group, ascorbic acid group, and control group were 56.6±5.52%, 65.60±10.77%, 29.6±6.03%, and 17.76±5.99%, respectively. The percentage of beating EBs in co-culture & ascorbic acid group was much higher and the homogeneity of EBs was significantly improved over that seen in other groups (p<0.01), simultaneously, the automaticity of beating also maintained for more time. The majority (>90%) of cells in EBs were ESC-Ms that acquired almost the same structural and functional properties as typical CMs.

**Conclusions** The present study demonstrates the cardiomyogenic differentiation of ESCs can be efficiently controlled by co-cultured with native CMs, and this may lead to a practicable cocktail approach to generate ESC-derived CMs for stem cell-based regenerative medicine.

**e0232** THE CHANGE OF VENTRICULAR INA AT DIFFERENT TIME OF SIMULATED ISCHAEMIA AND THE EFFECT OF ATORVASTATIN

Li Hongshi, Bian Bo, Wan Zheng, Teng Tianming, Wang Fang. Tianjin Medical University General Hospital, Tianjin, China

**Objective** To observe time dependent effects of simulated ischaemia on transient sodium currents (I_{Na}) of rat left ventricular myocytes, and the effects of atorvastatin on ischaemia I_{Na}.

**Methods** 80 Wistar rats were used for isolating left ventricular myocytes, which were randomly divided into two groups: ischaemia group (normal → simulated ischaemia) and statin group (normal → simulated ischaemia with 5 μmol/l atorvastatin). I_{Na} were recorded in normal condition (for control) by whole-cell patchclamp. Then in simulated ischaemia condition, I_{Na} were recorded from 3 to 21 min, monitored normalised peak currents every 2 min, and compared gate parameters between normal and simulated ischaemia (5 min) condition.

**Results** a. Normalised currents (at ~40 mV), in ischaemia group, compared with normal (0.95±0.04), the currents in simulated ischaemia were increased to peak at 3 min (1.15±0.08, p 0.05, respectively), and decreased at 21 min (0.56±0.13, p 0.05); b. Gate parameters, from normal to simulated ischaemia condition at 3 min, membrane potential at 50% maximal activation (V_{1/2,a}), offsetting of activation curve (K_a), membrane potential at 50% maximal inactivation (V_{1/2,i}) and deinactivation constant (τ) were decreased (p<0.01, respectively) in ischaemia group, but offsetting of inactivation curve (K_i) were not changed; compared between two groups, K_i of statin group were decreased (p<0.05) and the decrease of τ value in statin group were less than ischaemia group (p<0.05).

**Conclusions** The effects of simulated ischaemia on I_{Na} are time dependent, while I_{Na} is transient increased at 3 min, and atorvastatin can depress this process.

**e0233** LATE GADOLINIUM-ENHANCED MRI IN RESTRICTIVE CARDIOMYOPATHY

Chen Yan, Meng Yan. Shanghai 9th People’s Hospital of Tongji Medical College, Tongji University, Shanghai, China

**Objective** To evaluate the diagnostic value of MRI in combination of late gadolinium-enhanced imaging in the identification of restrictive cardiomyopathy (RCM).

**Methods** 116 patients with RCM underwent ECG, x-ray, Echocardiography and MRI. The final diagnosis was made on comprehensive evaluation in consideration of patients’ history, clinical symptom and sign, imaging modalities. All patients had objective evidence of impaired cardiac filling and were referred to rule out pericardial thickening. Five histologically proven cases with RCM included heart transplantation in four patients with RCM, endomyocardial biopsy in one patient with RCM. Fifty-five normal subjects were used for reference. All patients were divided into two groups according to contrast-enhanced MRI: RCM with delayed enhancement (RCM with DE, n=35) and RCM without delayed enhancement (RCM without DE, n=81). Quantitative measurement of bi-atrial and bi-ventricular size, ventricular septal and left free wall thickness were done. A paired t-test was used for statistic analysis and a p value of less than 0.05 was considered significant. Qualitative assessment of segmental wall motion, in this present study.

**Results** The parameters, such as bi-atrial size, right ventricular diastolic diameter (RVDD), ventricular septal and left free wall
