Methods 1307 in-patients with ST segment elevation ACS from 64 hospitals across China were received different therapies in hospitals and a standard questionnaire was used to get information of the patients including demographic, treatments and in-hospital outcomes. We analysed the status of application of reperfusion and aspirin, ACEI, β-blocker, LWMH, Clopidogrel and cholesterol lowering agents on ST segment elevation ACS patients.

Results 1. The were no significant differences in baseline characteristics between the patients from tertiary hospitals and that from the secondary hospitals. 2. 30.9%–69.4% received reperfusion therapies. 1.3%–62.7% received primary PCI, 1.9%–45.8% received Thrombolysis, and nearly 46.2% did not receive any form of reperfusion. Reperfusion therapy was more often used in tertiary hospitals (45.2%) than in secondary hospitals (64.6%). Thrombolysis was more often in secondary hospitals than that in tertiary hospitals (56.8% vs 14.6%) 3. Percentage of medications in ST ACS patients in different areas: aspirin (88.0%–90.9%), 6%, ACEI (60.5%–84.4%), β-blocker (55.6%–84.4%), LWMH54.2%–94.2%, Clopidogrel (14.3%–88.6), cholesterol lowering agents Statins (91.9%–90.9%). 4. Major in-hospital events and death rates were significantly higher in secondary hospitals than in tertiary hospitals; 5. Mortality and congestive heart failure rate were significantly higher in patients with no reperfusion therapy compared to patients underwent reperfusion. The incidence of combined outcomes (death or MI, and death, MI or Stroke) was also higher in patients without reperfusion therapy 6. Multivariate logistic regression analysis showed that age > 75 years, hypertension, diabetes, reperfusion, aspirin, β-blocker, ACEI/ARB inhibitor use were associated independently with in-hospital mortality.

Conclusion In the most tertiary hospitals in China the application of medications being proved effective by evidence-based medicine in clinical practice is better than that of the secondary hospitals, but there is a big gap between guidelines and current management of ST segment elevation ACS in China, and the application status in China could be further improved.
**Method** We carried out the research by multi-steps random sampling through questionnaires. 1512 records had been completed for analysis. Indicators as smoking, age, education, occupation and income, etc., were calculated.

**Results** The total smoking rate was 23.8%, 52.4% in male and 4.0% in female. The smoking rates of different education, occupation and income had statistical differences.

**Conclusion** The smoking rate of Shougang district was lower than that of Beijing and the whole country. The smoking rate in male was significantly higher than that in female. It is very important to develop the health education and the smoking control in some special people.

**E0263** EPIDEMIOLOGICAL SURVEY OF HYPERTENSION IN GENERAL ADULT POPULATION OF DIFFERENT NATIONALITIES IN XINJIANG
doi:10.1136/hrt.2010.208967.263

Huang Ying, Ma Yitong, Liu Fen, Yang Yining, Li Xiao-Mei, Sun Minghui, Yao Juan, An Yong, Yao Juan An Yong

**Objective** To estimate the prevalence and distribution of hypertension and to determine the status of hypertension awareness, treatment, and control in Xinjiang.

**Methods** The Cardiovascular Risk Survey in Xinjiang, A total of 14 618 adults, age ≥35 years in Xinjiang.

**Results** The standardisation prevalence is 42.25%. Prevalence rate of hypertension is 42.44% in Han, 35.2% in Uygur, 53.04% in Kazak respectively. Among hypertensive patients, only 45.5% were aware of their high blood pressure, 19.7% were taking antihypertensive medication, and 11.5% achieved blood pressure control (<140/90 mm Hg). These data are 46.7%, 29.6%, 6.1%, 45.8%, 18.5%, 14.2%, 41.5%, 14.5%, 4.0% as sequence in Han, Uygur and Kazak.

**Conclusions** Our results indicate that hypertension is highly prevalent in Xinjiang. The percentages of those with hypertension who are aware, treated, and controlled are relatively low.

**E0264** INVESTIGATION ON BLOOD LIPIDS OF THE LI NATIONALITY IN HAINAN ISLAND
doi:10.1136/hrt.2010.208967.264

Yunbo Zhang, Zhen Yao, Yong Zhang, Ying Li, Ruijan Ma, Shijiao Yan. The People’s Hospital of Sanya

**Objective** To study the blood lipid level of the Li nationality in Hainan Island, and to compare it between Li nationality and other people. To analyse the effects of the way of life style and the Polymorphisms of blood lipid gene on the levels of blood lipids.

**Methods** The epidemiological study was carried out in a natural population 1000 (500 samples from the Li nationality and 500 samples from the Han nationality) individuals aged aged between 30 and 50 from Li Nationality in Hainan area by cluster and random sampling. To measure TC, TG, LDL-C, HDL-C according to “Suggestion on protocol of measuring serum lipidaemia and standardisation”, the data were analysed by SPSS 15.0.

**Results** There were no differences about the levels of TC, TG, HDLC and LDL-C between the Li nationality and the Han nationality, but there were significant difference about the levels of HDL-C between two population (p<0.05). The levels of HDL-C in the Li nationality was significantly higher than that in the Han nationality among female (p<0.05), and the levels of TG in the Han nationality was significantly higher than that in the Li nationality among male (p<0.05). The levels of HDL-C in the Li nationality was significantly higher than that in the Han nationality in the group of age 30–59 and the group of age 40–49 (p<0.05).

**Conclusions** There were statistical difference about the levels of the blood lipids between the Li and the Han nationality. The reason could be that the Li nationality living in the poor area who are under low living standard. The different Polymorphisms of blood lipid genes may be one of the causes.

**E0266** ANALYSIS OF 24 H SLEEP DEPRIVATION ON ARRHYTHMIA AND HEART RATE VARIABILITY
doi:10.1136/hrt.2010.208967.265

Wei-Ren Chen, Xiang-Min Shi. Pla General Hospital

**Background** Sleep deprivation (SD) is a common phenomenon in emergency, especially during war time, conflict, natural disasters or disease crisis such as SARS, it can cause exhaustion in members of armed forces and non-combat casualty. In conditions of high-tech war, deprivation is becoming more serious and mandatory than ever before.

**Objective** To study the impact of 24-h sleep deprivation on arrhythmia and heart rate variability (HRV).

**Methods** Soldiers were used as research objects, they were divided into normal group and the sleep deprivation group. 1. Heart rate, atrial premature beat, ventricular premature beat and heart rate variability were observed by 24-h ambulatory ECG during sleep deprivation. 2. The changes of serum cortisol levels were detected during sleep deprivation.

**Results** 1. After 24 h sleep deprivation, HF, SDNN and RMSSD significantly reduced, LF significantly increased, LF /HF showed a significant increase. 2. Part of volunteers presented atrial premature beats and ventricular premature beats. 3. The level of serum cortisol significantly increased.

**Conclusion** The underlying mechanism of alteration of arrhythmia and HRV after 24-h sleep deprivation would be ascribed to lower vagal activity and elevated sympathetic activity.

**E0265** SNORING IS ASSOCIATED WITH SUBCLINICAL CAROTID ATHEROSCLEROSIS IN 1050 URBAN CHINESE
doi:10.1136/hrt.2010.208967.266

Li Yan, Zhao Dong, Liu Jing, Wang Wei. Capital Medical University Affiliated Beijing Anzhen Hospital, Beijing Institute of Heart, Lung and Blood Vessel Diseases

**Context** Epidemiological studies have identified snoring as a risk factor for atherosclerotic cardiovascular diseases. However, there is little evidence on snoring and subclinical atherosclerosis.

**Objective** To evaluate whether and to what extent snoring is associated with carotid atherosclerosis.

**Methods** Population-based study was conducted at a community in Beijing on 1050 subjects aged 50–79 years who had an ultrasound examination of the carotid artery at age ranging from 45 to 74 years in 2002 and a carotid ultrasonic reexamination in 2007, as well as a cross-sectional survey including snoring information and cardiovascular risk factors from September to November 2007.

**Main Outcome Measures** Carotid intima-media thickness (IMT) and plaque as two indexes of carotid atherosclerosis were diagnosed by B-mode ultrasonography. Association of snoring with increased IMT and plaque were analysed by multivariable logistic regression models adjusted for cardiovascular risk factors.

**Results** The prevalence of snoring was 64.3% in this population (71.4% in males and 58.4% in females). In multivariable models adjusted for traditional risk factors, snoring was significantly associated with increased IMT of common carotid artery (CCA) (OR, 1.38; 95% CI 1.04 to 1.82) and bifurcated carotid artery (BCA) (OR, 1.65; 95% CI 1.24 to 2.19), with having plaque of CCA (OR,
