1.62; 95% CI 1.01 to 2.58) and BCA (OR, 2.39; 95% CI 1.79 to 3.18), with newly detected increased IMT of BCA (OR, 1.60; 95% CI 1.11 to 2.30), and with newly detected plaque of BCA (OR, 2.14; 95% CI 1.57 to 2.93).

Conclusion There were distinct associations between snoring and carotid atherosclerosis, which provides evidence for a relation between snoring and subclinical atherosclerosis.

**e0267** PREDICTION OF THE NEWLY-IDENTIFIED CAROTID PLAQUE WITH BLOOD LIPID LEVELS IN CHINESE ELDERLY POPULATION

Wang Wei, Huo Yong, Zhao Dong, Lu Jing, Sun Jiayi, Wang Miao, Wu Yangfeng. Department of Epidemiology, Capital Medical University Affiliated Atrachan Hospital, Institute of Beijing Heart, Lung and Blood Vessel Diseases, Beijing China

Objective To provide the changing prevalence of carotid plaque in a Chinese elderly population from 2002 to 2007 and accordingly evaluate the predictive effect of baseline lipid levels of interest on the newly-identified carotid plaque.

Methods All study subjects were recruited from two cohorts, viz. the People’s Republic of China/United States of America Collaborative Study (USA-PRC Study) and the Chinese Multi-provincial Cohort Study (CMCS). The baseline examination was taken in 2002 including CVD risk factors and B-mode ultrasound of carotid artery and the second examination was carried out in 2007. The carotid plaque was measured in a total of 2000 subjects aged 47–79 years (mean 63 year).

Results 1. During these 5 years, the prevalence of carotid plaque increased from 50.3% to 62.2% and from 21.5% to 51.5% for men and women, respectively. The newly-identified carotid plaque incidence reached 41.8% for men and 34.1% for women. 2. With the increase of baseline total cholesterol (TC), low-density lipoprotein cholesterol (LDL-C), triglyceride (TG), except for men, non-high-density lipoprotein cholesterol (non-HDL-C), and total to high-density cholesterol ratio (TC/HDL-C) levels, the artery plaque incidence significantly increased in both sexes (p<0.05). 3. Cross-stratification analysis of LDL-C, TG and HDL-C for carotid plaque incidence indicated the existence of joint effects between LDL-C and HDL-C, LDL and TG, as well as between TG and HDL-C, on the elevated carotid plaque. For example, at the normal levels of LDL-C and HDL-C, the plaque incidence was 23.3%, whereas the abnormal levels of these two lipids yielded an exceedingly high incidence of 49.0%. 4. In multifactorial analysis, higher LDL-C, non-HDL-C and TC/HDL-C was recognised as an independent factors of carotid plaque incidence (RR=1.44, 95% CI 1.07 to 1.94; RR=1.45, 95% CI 1.08 to 1.96; RR=1.59, 95% CI 1.14 to 2.23 in men; RR=1.47, 95% CI 1.13 to 1.92; RR=1.35, 95% CI 1.04 to 1.75; RR=1.64, 95% CI 1.20 to 2.25 in women).

Conclusion The prevalence of carotid plaque increased rapidly in a Chinese elderly population. Elevated LDL-C, non-HDL-C and TC/HDL-C levels serve as predictor of carotid plaque incidence.

**e0268** SUBENDOCARDIAL VIABILITY RATIOS IN RESIDENTS OF A COMMUNITY IN JINAN CITY, SHANDONG PROVINCE

Liu Zhongdong, Lu Fanghong, Zhao Yingxin, Wang Shujian, Yang Jianmin. Cardiovascular Control and Research Center, Institute of Basic Medicine, Shandong Academy of Medical Sciences

Objective The subendocardial viability ratio (SEVR) measures myocardial perfusion related to cardiac workload. The chief aim of this work was to investigate the relationship between SEVR and cardiovascular risk factors.

**e0269** IMPACT FACTORS ON BRACHIAL ANKLE PULSE WAVE VELOCITY IN XINJIANG HAN AND UYGUR HOSPITALISED PATIENTS

Hasimu Buaijiaer, Ma Yitong, Maimaitiming Gulthae, Tang Baopeng, Yuan Binbin. Department of Cardiology, Nanjing Benz Hospital, The Affiliated Hospital, Nanjing Medical Hospital, Heart Center, The First Hospital, Xinjiang Medical University, Urumqi

Objective To compare impact factors on Ankle Brachial Pulse Wave Velocity (baPWV) in Xinjiang Uygur and Han hospitalised patients and evaluate the clinical significance of baPWV.

Methods Using Colin Noninvasive Atherosclerosis detector BP-203RF II (VP-1000), baPWV was measured in 5000 Xinjiang Han and Uygur hospitalised patients from the first hospital of Xinjiang Medical University, including 2738 Han and 2262 Uygur. Patients were divided into baPWV=1400 cm/s (1573Han, 1327 Uygur) and baPWV<1400 cm/s groups (1165Han, 935Uygur). Multivariable logistic regression analyses were performed to identify factors associated with baPWV.

Results In both Han and Uygur, Patients with baPWV<1400 cm/s were older than those baPWV<1400 cm/s, and more frequently had diabetes, stroke and hypertension. No significant differences in gender between two groups. Multiple regression analysis showed that baPWV was significantly associated with pulse pressure, age and hypertension. HDL-C might be protective factor for two ethnicities, Ca++ antagonist might be risk factor of baPWV for Uygur patients.

Conclusion In Xinjiang Uygur and Han hospitalised patients, higher baPWV was associated with generalised atherosclerosis. baPWV should be a routine measurement in hospitalised patients. Influenced factors were different in two nationalities, For Uygur patients, influencing of antihypertensives on baPWV should be under consideration.

**e0270** THE TRENDS OF CARDIOVASCULAR DISEASE OF UYGUR POPULATION IN HOTAN XINJIANG CHINA. A SURVEY FROM 1996 TO 2005

Yakefu Kalibinuer, Hasimu Buaijiaer, He Bingxian, Yuan Binbin. Heart Center, The First Hospital of Xinjiang Medical University, Department of Cardiology, Nanjing Benz Hospital, The Affiliated Hospital of Nanjing Medical University

Objective In order to understand better the trend of changes in cardiovascular disease of Uygur population in hotan prefecture. A ten year study from 1996 to 2005.

A84 Heart October 2010 Vol 96 Suppl 3

Heart first published as 10.1136/hrt.2010.208967.267 on 17 November 2010. Downloaded from http://heart.bmj.com/ on February 5, 2021 by guest. Protected by copyright.
Methods A study was made cardiovascular disease of uygur population in hotan prefecture by registration in patients from Guma county hospital Total annual number of cardiovascular disease and coronary heart disease, Essential Hypertension, rheumatic heart disease, Cardiomyopathy, Pulmonary heart disease, Congenital heart disease and out comes were analysed.

Result The percentage of EH from 1996 13.7% to 2005 22.4%, the percentage of CHD from 1996 7.6% to 2005 14.2 % the percentage of rheumatic heart disease from 1996 1.6% to 2005 5.5% the percentage of cardiomyopathy from 1996 1.9% to 2005 3.3% Pulmonary heart disease from 1996 4.4% to 2005 5.7%, the trend in cardiovascular diseases of Uighur population in hotan prefecture resent10 years was change gradually, the annual percentage of Essential Hypertension, Coronary heart disease are rising significantly in resent 10 years, the annual percentage of rheumatic heart disease and Cardiomyopathy are slightly increased during this period (all p<0.05).

Conclusion Prevention for cardiovascular disease should be strengthened in this area.

The Trend of Cardiovascular Disease of Uygur Hospitalised Patients in Xinjiang Hetian. A Survey From 1996 to 2005

Objective To investigate the trend of changes in cerebral-vascular disease of Uygur hospitalised patients in Hetian from 1996 to 2005.

Methods Medical records of Uygur hospitalised patients from karakax county hospital and Gumar country hospital were investigated. Total annual number of cardiovascular disease and coronary heart disease (CHD), essential hypertension (EH), rheumatic heart disease, cardiomyopathy, pulmonary heart disease, congenital heart disease and out comes were analysed.

Result the percentage of EH from 1996 12.6% to 2005 21%, the percentage of CHD from 1996 8.8% to 2005 16.7 % the percentage of rheumatic heart disease from 1996 1.3% to 2005 3.2% the percentage of cardiomyopathy from 1996 1.2% to 2005 2.5% the trend in cardiovascular diseases of Uygur population in Hetian prefecture resent 10 years was change gradually, the annual percentage of EH, CHD are rising significantly in resent ten years, the annual percentage of rheumatic heart disease and cardiomyopathy are slightly increased during this period (all p<0.05) the annual percentage of pulmonary heart disease, congenital heart disease had no significantly change in resent ten years (all p>0.05).

Conclusion the percentage of EH, CHD are rising significantly in the Uygur population of this area. the percentage of rheumatic heart disease, Cardiomyopathy slightly increased during this period. Other Cardiovascular diseases had no significantly changes in resent ten years. Prevention for cardiovascular disease spatially CHD and EH should be strengthened in this area.

Low Testosterone Levels are Inversely Associated with Carotid Artery Plaque Formation

Objective To study the relationship between endogenous sex hormone levels and atherosclerosis of the carotid artery measured by ultrasonography.

Methods Analysis of the healthy elders from a population-based cohort study in 9 communities of Beijing, carotid intim-a-media thickness (IMT) and atherosclerotic plaques were determined ultrasonographically. Sex hormone levels were measured by immunoassay. The data were analysed with ANOVA and logistic regression analysis.

Results There was a inverse association between testosterone and plaque formation in females (p<0.001), whereas no association was found in males. Logistic regression analysis showed that females with a testosterone level in the lowest quintile (<0.49 nmol/l) were more likely (OR=3.11, p=0.002) to be in the plaque formation independently of age and the other risk factors. Age (OR=1.07 year-1), LDL (OR=1.65, p=0.027), physical exercise (OR=0.54, p=0.006), and IL-6 (OR=1.05, p=0.022) were also independently associated with plaque formation.

Conclusions Testosterone concentrations are negatively associated with carotid artery atherosclerosis in females, experimental and prospective studies are needed to determine the possible therapeutic role of testosterone in atherosclerosis.

Relationship of Peripheral Arterial Disease, Chronic Kidney Disease, and Mortality in Chinese Hypertensive Patients

Objective To investigate the associations of chronic kidney disease (CKD), Peripheral arterial disease (PAD) and their combined effect with all-cause and Cardiovascular disease (CVD) mortality in Chinese hypertensive patients. Chinese ankle brachial index (ABI) cohort study including 2992 hypertensive patients aged 35 years or older were enrolled in 2004 and implemented the follow-up visit in 2007. 2505 participants completed baseline and follow-up data. Glomerular filtration rate (GFR) was estimated using the Modification of Diet in Renal Disease equation. ABI was calculated at baseline by measuring systolic pressures on bilateral brachial and tibial arteries. Mortality surveillance was completed from December 2007 to February 2008. Survival analysis was used to compare survival rate in different CKD/PAD groups. The RR of death from all-cause and CVD were adjusted for potential confounders using a Cox regression model. The prevalence of PAD in hypertensive patients with and without CKD was 43.1% and 22.8%, with significant difference between them (p<0.001). For CKD and PAD group, PAD alone group, CKD alone group and neither CKD nor PAD group, the all-cause mortality was 38.6%, 19.6%, 17.3%, 10.5%, and CVD mortality was 23.3%, 13.7%, 11.5%, 5.4%, respectively, with significant differences among each other (p<0.001). The survival rate was significantly lower in CKD and PAD group than in other three groups, for both all-cause and CVD mortality (log-rank: p<0.001). The patients in CKD and PAD group, PAD alone group and CKD alone group had the adjusted RRs of 2.966 (95% CI 2.220 to 3.964), 1.523 (95% CI 1.151 to 2.016) and 1.484 (95% CI 1.067 to 2.063) for all-cause mortality and 3.402 (95% CI 2.343 to 4.939), 2.024 (95% CI 1.454 to 2.526), 1.845 (95% CI 1.225 to 2.773) for CVD mortality, with no CKD or PAD group as the reference. Our study indicated that CKD is a risk factor for PAD. The hypertensive patients combined CKD and PAD had the highest risk for all-cause and CVD mortality. We suggest CKD patients should take ABI measurement for PAD early diagnosis and treatment, and GFR should be used to estimate renal function for PAD patients.
