Objectives to investigate the effect of aldosterone on L-type calcium channel and electrophysiological features on cardiocytes.

Methods Single ventricular myocytes were isolated by enzymatic dissociation method. Isolated adult rat ventricular myocytes exposed for 48 h to aldosterone 100 nmol/l, APD and $I_{Ca,L}$ were recorded by using whole cell patch clamp technique.

Results we observed an increase in the APD 50, APD90 and $I_{Ca,L}$ in Ald group, I-V curve of $I_{Ca,L}$.

Conclusions Aldosterone on cardiocytes increase in the APD and $I_{Ca,L}$ which may contributes to cardiac arrhythmia.
